1 Introduction

The Redfish Scalable Platforms Management API ("Redfish") is a new interface that uses RESTful interface semantics to access data defined in a model format to perform out-of-band systems management. It is suitable for a wide range of servers, from stand-alone to rack mount and blade environments, but scales equally well for large scale cloud environments.

Redfish is a management standard which uses data model representation inside of a hypermedia RESTful interface. It is based on REST, that’s how Redfish is easier to use and implement than many other solutions. Since it’s model oriented, it is capable of expressing the relationships between components in modern systems as well as the semantics of the services and components within them. It is also easily extensible. By using a hypermedia approach to REST, Redfish can express a large variety of systems from multiple vendors. Utilizing JSON (JavaScript Object Notation) data format which is in plain text, allows many types of parameters to be available such that it enables scalability, human readability, and flexibility for most programming environments by easily interpreting payload.

The model is exposed in terms of an interoperable OData Schema with the payload of the messages being expressed in JSON following OData JSON conventions. The schema (available in both XML and JSON formats) includes annotations to facilitate the automatic translation of the schema to JSON Schema. The ability to externally host the schema definition of the resources in a machine-readable format allows the meta data to be associated with the data without encumbering Redfish services with the meta data, thus enabling more advanced client scenarios as found in many data center and cloud environments.

This document will provide you with an overview of Restful API services and describe how to receive Redfish API responses directly from a Supermicro BMC (Baseboard Management Controller).

2 HTTP Request Methods

The following HTTP methods are used to implement different actions, as described below.

- **Read Requests (GET):**
  The GET method is used to request a representation of a specified resource. The representation can be either a single resource or a collection.

- **Update (PATCH):**
  The PATCH method is used to apply partial modifications to a resource.

- **Replace (PUT):**
The PUT method is used to completely replace a resource. Any properties omitted from the body of the request are reset to their default value.

- **Create (POST):**
  The POST method is used to create a new resource. This request is submitted to the resource collection in which the new resource is meant to belong.

- **Actions (POST):**
  The POST method may also be used to initiate operations on the object (Actions). The POST operation may not be idempotent.

- **Delete (DELETE):**
  The DELETE method is used to remove a resource.

### 2.1 Responses

Four types of responses are supported, as defined below.

- **Metadata Responses:**
  These describe the resources and types exposed by the service to generic clients.

- **Resource Responses:**
  JSON representation of an individual resource.

- **Resource Collection Responses:**
  JSON representation of a collections of resources.

- **Error Responses:**
  Top-level JSON response providing additional information in the case of an HTTP error.

### 2.2 HTTP Status Code Description

<table>
<thead>

### 2.3 List of Available APIs

```
/redfish/v1/
/redfish/v1/Chassis
/redfish/v1/Chassis/1
/redfish/v1/Chassis/1/Thermal
/redfish/v1/Chassis/1/Power
/redfish/v1/Managers
/redfish/v1/Managers/1
/redfish/v1/Managers/1/NetworkProtocol
/redfish/v1/Managers/1/EthernetInterfaces
/redfish/v1/Managers/1/EthernetInterfaces/1
/redfish/v1/Managers/1/SerialInterfaces
/redfish/v1/Managers/1/SerialInterfaces/1
/redfish/v1/Managers/1/LogServices/
/redfish/v1/Managers/1/LogServices/Log1/
/redfish/v1/Managers/1/LogServices/Log1/Entries
/redfish/v1/Managers/1/LogServices/Log1/Entries/[num]
/redfish/v1/Managers/1/MouseMode
/redfish/v1/Managers/1/SMTP
/redfish/v1/Managers/1/ActiveDirectory
/redfish/v1/Managers/1/Actions/Oem/ManagerConfig.Reset
/redfish/v1/Managers/1/LogServices/Log1/Actions/LogService.Reset – (POST)
/redfish/v1/Managers/1/Actions/Manager.Reset – (POST)
/redfish/v1/SessionService/
/redfish/v1/SessionService/Sessions/
```
3 Using RESTful APIs

Begin by installing PostMan or Advanced REST client plug-ins in your browser (either Chrome or Firefox).

3.1 Authentication

Redfish supports both "Basic Authentication" and "Redfish Session Login Authentication" (as described below under Session Management). Service does not require a client to create a session when Basic Authentication is used.

3.1.1 Basic Authentication

HTTP BASIC authentication uses compliant TLS connections to transport the data between any third party authentication service and clients.

Example: The following example uses Postman (a web API application) to display a chassis response using Basic Authentication.
Note: Always check the status code once you get the response from the Redfish URL. You can refer to the status code table mentioned above. (All URLs/commands are case sensitive.)

3.1.2 Session Management

Redfish Service uses session management to implement authentication. This includes orphaned session timeouts and a number of simultaneous open sessions.

Step1. User can Post the following username/password information to the Post payload field, which will create a new session.

```javascript
{
    "UserName": "<username>",
    "Password": "<password>"
}
```

Example of applying for Authentication using a Chrome-based app (Advanced Rest Client):

1. Enter this URL into your browser: https://BMC ip/redfish/v1/SessionService/Sessions
2. Apply the POST method with username/password info inside the payload and send it.
3. The user will receive 201 messages created with X-AUTH token code.
• Users can create maximum of 16 sessions.

• **Session Lifetime**: For Redfish sessions, as long as a client sends requests for the session within the session timeout period, the session will remain open and the session authentication token will remain valid. If the session times-out, the session will be automatically terminated. The default session timeout is 30 minutes. If a user is not active for 30 minutes, the token will be rendered invalid.

Users can always modify the “SessionTimeout” by using IPMI web or a patching operation from Redfish.

Example: [PATCH] https://IP/redfish/v1/SessionService
Payload: {"SessionTimeout": 20} ->Send->Status Code: 200 OK

• **Session Termination or Logout**: A Redfish session is terminated when the client logs-out. This is accomplished by performing a DELETE to the session resource identified by the link returned in the location header either when the session was created or if the Session ID is returned in the response data. The ability to DELETE a session by specifying the session resource ID allows an administrator with sufficient privilege to terminate other users sessions from a different session.

Example: [DELETE] https://IP/redfish/v1/SessionService/Sessions/2(num) ->Send->Status Code: 200 OK

<table>
<thead>
<tr>
<th>Operation</th>
<th>Log in</th>
<th>Log Out</th>
</tr>
</thead>
<tbody>
<tr>
<td>POST</td>
<td>redfish/v1/SessionService/Sessions/</td>
<td>DELETE</td>
</tr>
<tr>
<td>Request headers:</td>
<td>Content-Type: application/json</td>
<td>Request headers:</td>
</tr>
<tr>
<td>Request body:</td>
<td></td>
<td>Content-Type: application/json</td>
</tr>
</tbody>
</table>

---

**Log in**

**Log Out**

**Operation : POST**

**Operation: DELETE**

**URI: redfish/v1/SessionService/Sessions/**

**URI: redfish/v1/SessionService/Sessions/(num)**

**Request headers:**

Content-Type: application/json

**Request headers:**

Content-Type: application/json

---

Supermicro Redfish Reference Guide 8
Step2. The response will include an X-Auth-token header with a session token and a location header. Copy “X-Auth-Token: <Value>” and parse it to the HTTP header in order to GET API response.

- Parse X-Auth token value to get API response:

3.2 Examples

Users can integrate current APIs into their software and applications in order to receive all services provided by Redfish APIs.
3.2.1 Redfish API Response for Chassis/Thermal

```
{
   @Redfish.Copyright: "Copyright © 2014-2015 Distributed Management Task Force, Inc. (DMTF). All rights reserved."
   @odata.context: "/redfish/v1/$metadata#Chassis/Members/1/Thermal/$entity"
   @odata.type: "#Thermal.1.0.0.Thermal"
   @odata.id: "/redfish/v1/Chassis/1/Thermal"
   Name: "Thermal"
   Temperatures: [30]
   Fans: [4] 0:
      @odata.id: "/redfish/v1/Chassis/1/Thermal#/Fans/0"
      MemberID: "0" Status:
      { State: "Enabled" Health: "OK"
      }
      UpperThresholdNonCritical: 25300
      UpperThresholdCritical: 25400
      UpperThresholdFatal: 25500
      LowerThresholdNonCritical: 700
      LowerThresholdCritical: 500 LowerThresholdFatal: 300
   PhysicalContext: "Backplane"
   RelatedItem: [2] 0:
      {@odata.id: "/redfish/v1/Systems/1"} 1:
      {@odata.id: "/redfish/v1/Chassis/1"} FanName: "FAN1"
   ReadingRPM: 7500 MinReadingRange: 702
   MaxReadingRange: 25298
```
3.2.2 Redfish API Response for Systems/1/Processor/1

```
{
@Redfish.Copyright: "Copyright © 2014-2015 Distributed Management Task Force, Inc. (DMTF). All rights reserved."
@odata.context: "/redfish/v1/$metadata#Systems/Members/1/Processors/
Members/$entity"
@odata.id@odata.type: ":/redfish/v1/Systems/1/Processors/
"#Processor.1.0.0.Processor" 1"
Id: "1"
Name: "Processor"
Description: "Processor"
Socket: "CPU1"
Manufacturer: "Intel"
Model: "Intel(R) Xeon(R) processor"
MaxSpeedMHz: 4000
TotalCores: 12
TotalThreads: 24
ProcessorType: "CPU"
ProcessorArchitecture: "x86"
InstructionSet: "x86-64"
ProcessorId:
{
  VendorId: "GenuineIntel"
  IdentificationRegisters: "0xBFEBFBFF000306F2"
  EffectiveFamily: "0x6"
  EffectiveModel: "0x3F"
  Step: "0x2"}
Status: {
  State: "Enabled"
  Health: "OK"}
```
3.2.3 Python Code for Redfish API Response

```python
base_url = 'https://IP/redfish/v1/Managers/1/SerialInterfaces/1'
dict_host = requests.get(base_url).json()
print(json.dumps(dict_host, indent=2))
```

Output:
```
{
  "@odata.type": "#SerialInterface.1.0.0.SerialInterface",
  "Parity": "None",
  "Name": "SerialInterfaces",
  "DataBits": "8",
  "@odata.id": "/redfish/v1/Managers/1/SerialInterfaces/1",
  "@odata.context": "/redfish/v1/Managers/1/SerialInterfaces/1/$metadata#SerialInterface.1.0.0.SerialInterface",
  "FlowControl": "None",
  "SignalType": "Rs232",
  "StopBits": "8",
```

3.4 Event Service

The event service is a new alert mechanism for Redfish. This alert will be sent out through http to the web server that is subscribed to by the users.

First, user needs to add a subscription to inform Redfish who will receive this event.

After user adds subscriptions, he can use the action “SendTestEvent” to send a testing event.

Alternatively, user can generate an event in the BMC and Redfish will automatically send an event alert to the destination(s) in the subscriptions. For this reason, you need to implement the event listener, which is like a web server that can receive https POST data that describes the Redfish event format.

For the current stage, user can launch Wireshark on the destination to sniff the packet to learn user receive the Redfish event.

```
To add a subscription:
[Post]https://IP/redfish/v1/EventService/Subscriptions/
- User can subscribe to a max. Of 16 events.
```
To see all subscriptions:

[GET] https://IP/redfish/v1/EventService/Subscriptions/

To send a testing event:

[POST] https://IP/redfish/v1/EventService/Actions/EventService.SendTestEvent  
{"EventType":"Alert"}

User can delete events using the Delete service.

[DELETE] https://IP/redfish/v1/EventService/Subscriptions/1 (num)

### 3.5 OEM Features

#### 3.5.1 SMTP

SMTP is implemented at "redfish/v1/Managers/1" under OEM category.

This feature is identical to IPMI web -> Configuration->SMTP. User can GET/PATCH the same info for SMTP.

Information will be identical in both places.

User can use the [PATCH] HTTP method to modify properties.

PATCH:

A: SMTP SSL authentication Disabled:

```json
{
    "SmtpServer":"mailserver_ip or mailserver_name",
    "SmtpPortNumber": server_port,
    "SmtpUserName":"",
    "SmtpPassword":"",
    "SmtpSenderAddress":"sender_email_address"
}
```

B: SMTP SSL authentication Enabled:

```json
{
    "SmtpSSLEnabled":true,
    "SmtpServer":"mailserver_ip or mailserver_name",
    "SmtpPortNumber": server_port,
    "SmtpUserName":"user_name",
    "SmtpPassword":"user_password",
    "SmtpSenderAddress":"sender_email_address"
}
```

After applying the configurations, generate any system event to check if email-alert is receivable or not.

#### 3.5.2 FanMode

This is a Supermicro OEM feature that is implemented under /redfish/v1/Chassis. Users can Patch (modify) the Fan Mode using the following values.
The fan modes are defined as enum property as below (user can use any of following names):

```json
"FanMode@Redfish.AllowableValues":
    
    "Standard",
    "FullSpeed",
    "PUE2",
    "HeavyIO"
```

**Step:** Use the Patch operation and parse the following payload for your system.

```json
{
    "Oem": {
        "OemFan": {
            "FanMode": "PUE2"
        }
    }
}
```

### 3.5.3 Active Directory

1. 'GET' all managers under the URN "redfish/v1/Managers/1" to check if there is "ActiveDirectory" in "oem" category.
2. Then 'GET' its URN path: "redfish/v1/Managers/1/ActiveDirectory".
3. 'GET' / 'PATCH' are acceptable operations.
4. Then 'GET' its URN path: "redfish/v1/Managers/1/ActiveDirectory/RoleGroups".
5. 'GET' / 'POST'{"RoleGroupName":"xxx", "RoleGroupDomain":"xxx", "RoleGroupPrivilege":"Operator"} are acceptable operations.
6. Then 'GET' its URN path: "redfish/v1/Managers/1/ActiveDirectory/RoleGroups/ [no]".
7. Then 'GET'/ 'PATCH'/ 'DELETE' are acceptable operations.

### 3.5.4 Get/Set iKVM Mouse Mode

1. 'GET' Mouse mode setting under "redfish/v1/Managers/1/MouseMode".
2. Then 'PATCH' to path: "redfish/v1/Managers/1/MouseMode" by selecting allowable values.
   For example, {"Mode": "Relative") or one of the modes.
3. 'GET' Mouse mode again, and mode is "Relative".
4. 'GET' / 'PATCH' are acceptable operations.

### 3.5.5 Reset to Factory Default

1. 'POST' to path: "redfish/v1/Managers/1/Actions/Oem/ManagerConfig.Reset".
2. 'POST' is the only acceptable operations.

### 3.6 AccountService
User can perform the following operations under /redfish/v1/AccountService:

**POST / PATCH / DELETE operations**

```json
{
  "UserName":"User_Name",
  "Password":"User_Password",
  "RoleId":"role_id",  // Admin, Operator, ReadOnlyUser
  "Enabled":true
}
```

### 4. Posting an Action

The following Action items can POST with their respective URLs, which are supported by Redfish at this time.

- /redfish/v1/Managers/1/LogServices/Log1/Actions/LogService.Reset
- /redfish/v1/Managers/1/Actions/Manager.Reset
- /redfish/v1/Systems/1/Actions/ComputerSystem.Reset
- /redfish/v1/Managers/1/Actions/Oem/ManagerConfig.Reset

Each API will list available posting options under response. User can select any listed operation to post an action item.

Refer to the picture below. You should receive “status code 200” after posting any actions.
